

DAIS (Do as I Say) is a Semi-AI that works on your vocal instructions for now it can wish you, can make you laugh with jokes open any application in your system play music for you or read summary of a Wikipedia webpage can send emails to people but it also has flows of its own like

1. you have to manually execute its program so that it can hear your voice it doesn't have a speech recognition program but no worries one day it's gone have it. Next,

2. The music you tell it to play is random it still has to learn how play songs based on your mood this problem includes knowledge of deep learning I don't have that for now.

Currently I am trying to merge DAIS with Machine Learning so that it can build a model all by itself but it's gone take time and many more things I have in mind (the things you can do with an AI has a Sky high limit).
